for Regional Administrator and Deputy Regional Administrator
Hazardous Site Cleanup Division**

Perfluoroalkyl Substances (PFAS) Contamination in Public Drinking Water Supply of Blades, Delaware – Perfluoroalkyl Substances (PFAS), which includes Perfluorooctanoic Acid (PFOA) and Perfluorooctyl Sulfonate (PFOS), have been detected in the public drinking water supply of the Town of Blades in Sussex County, Delaware. The concentrations in the public supply wells are about twice the Health Advisory Level for PFOA/PFOS, which has prompted the State of Delaware to take actions to provide an alternative source of water to Town residents. The State has arranged for bottled water for affected residents. HSCD's Removal Program has been requested to assist the State with sampling and analysis of numerous private residential wells in the affected area. Sampling activities are scheduled during the week of February 12, 2018 and initial results are expected in about one week. (Eduardo Rovira, 4-3426)
